Dear [Company] hiring team,

I design AI systems end to end, then build them. I’ve shipped self-running infrastructure on my own: a job feed that updates itself from multiple sources, dashboards that pull data across tools automatically, and an AI content pipeline running inside a live SaaS. I’ve also architected an AI system that automates a complex, rules-heavy decision workflow, which is the kind of structured, high-stakes process that doesn’t leave much room for error.

My stack is TypeScript, Next.js, and Convex, with clean APIs and real-time data. Security background, so auth and data privacy are part of the design from the start.

For [Company]’s [Role], I’d map your data and decision flows first, then design where AI actually fits without breaking what already works. I’d rather get the architecture right than bolt something on and hope.

Happy to walk you through how I’d approach it.

Best,

Drey (Andre Thomas)
